

RECRUITER SUMMARY

Aman Agarwal

Security operations | Security engineering | Applied AI

MIS senior at Iowa State University with a Cybersecurity Engineering minor and CompTIA Security+. Former cybersecurity intern at HNI Corporation. Seeking junior roles in security analysis, SOC operations, threat intelligence, security engineering and AI.

Available January 2027 | Graduating December 2026

aagarwalcollege@gmail.com | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

Industry experience

HNI Corporation Cybersecurity Intern

May-July 2026 | Muscatine, Iowa

- Identity-alert automation in **Cortex XSIAM**; phishing and data-loss-prevention triage in Proofpoint.
- Python REST integrations for threat-intelligence context, scheduled synchronization and handoff documentation.
- Rego controls and Wiz queries for Azure security checks; operational documentation for SOC workflows.

Education & credentials

Iowa State University - B.S. Management Information Systems, Cybersecurity Engineering minor. Expected December 2026.

CompTIA Security+ - August 2025-August 2028. Microsoft Applied Skills: secure Azure storage. Wiz Cloud Core training.

Selected projects

SignalBridge / Local lab / Public source

A security workbench that collects signed events, applies detection rules and keeps the evidence behind each case available for review. Reproduced an access-revocation write race; moved the permission check into the transaction.

Python / Django / SQLite / Docker

BetTail / Deployed / Private source

An AI-assisted web app where private groups share sports picks, follow them with individual tickets and review results and group statistics.

TypeScript / Next.js / PostgreSQL / Supabase

Netted / Deployed beta / Private source

A personal-finance beta for realized trade profit, shared-fund accounting and budgeting, developed from a spreadsheet and a written requirements brief. Trade fees, purchase-date contribution shares and history-preserving corrections determine the recorded balances.

TypeScript / Next.js / PostgreSQL / Supabase

Downfield / Local research / In development

An NFL research app that assembles public source evidence, checks structured model output and preserves earlier forecasts when new information arrives. Report versions retain source snapshots and input gaps. Model probabilities remain uncalibrated.

Node.js / JavaScript / JSON Schema / AI CLI

Sailday / Deployed personal app / Private source

An installable cruise planner with hourly public-rate collection, booking comparisons, historical graphs, optional price-change notifications and offline group planning. Failed checks preserve saved observations; public rates remain distinct from confirmed personal offers.

JavaScript / React / PostgreSQL / Web Push / Service worker

Project implementation used AI coding agents under my direction. I set requirements and directed review. Case studies identify recorded checks, deployment status and open work; assessments are builder-led.
